DERMASTIR ZINC GLUCONATE

Zinc gluconate is the salt of gluconate and zinc II. It is an ionic compound consisting of two moles of gluconate for each mole of zinc. Zinc is an important element that is found in every cell in the body. More than 300 enzymes in the body need zinc in order to function properly. Although the amount of zinc we need in our daily diet is tiny, it's very important that we get it.

Benefit of Zinc for Skin

Zinc is one element that is essential for healthy skin. In addition, to wound healing, zinc acts as an astringent and may help in the treatment of skin redness among other benefits.

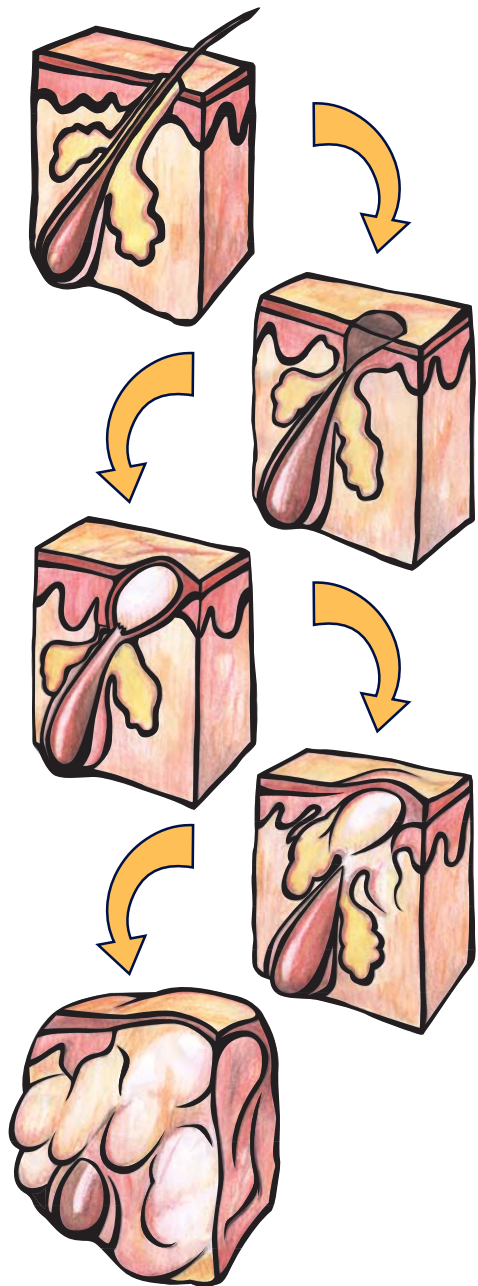

Wound Healing :

One benefit of zinc for skin is in the area of wound healing. Oral zinc supplements help heal bed sores, skin ulcers, cold sores, canker sores, surgical incisions, burns, and a variety of other skin irritations. Topical treatments are also used for wound healing.

Zinc is a mineral that the body requires for the synthesis of collagen, which is a requirement for the healing of skin wounds. Zinc is also a component in the proper functioning of enzymes that are required by the body to repair skin wounds.

Mild Astringent :

The benefit of zinc as a mild astringent is well noted. An astringent is a chemical substance that shrinks pores, constricts, or tightens body tissues.

Zinc gluconate has this mild astringent property. It acts as a skin-drying agent and can act as a skin anti-inflammatory. Zinc gluconate also helps sooth the skin from itching, rashes, and moist skin conditions such as diaper rash.

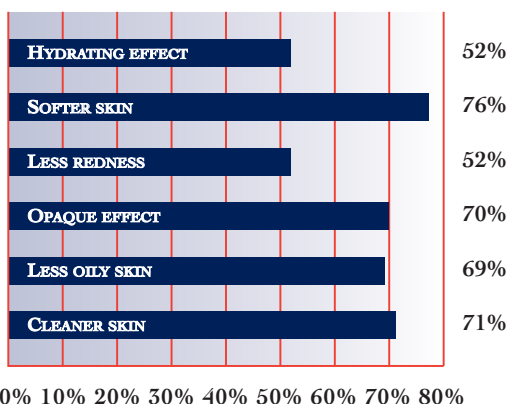

Zinc in the form of zinc gluconate or zinc sulfate is thought to help heal acne blemishes, reduce inflammation caused by acne, and reduce androgenic hormonal effects on skin that contribute to acne breakouts or in other words help regulate the skin’s oil gland activity.

Acne :

Another often stated benefit of zinc is in the symptomatic relief and prevention of acne.

Dandruff :

A benefit of zinc is in the treatment of
